History of Rh Prevention

The present world population of **7 billion** descended from just **1000** individuals in the *out of Africa exodus* **65,000** years ago. Some of these individuals were Rh negative. The founder effect would ensure that there were large mixes of Rh-negative and Rh-Positive individuals in various parts of the world. Rh Hemolytic disease of the Newborn **began 65,000 years ago.** It grew unabated for **65,000** years with population growth. Nothing could be done about it. Until 2019, when Stephen Spitalnik founded WIRhE, now an international organization centered in Amsterdam.

Rh Disease has been eradicated with Rh Immune Globulin in developed nations since about 1980. However, this means of protection for Rh-negative mothers has not been extended to the developing countries, where **140,000** Rh babies are still needlessly dying of Rh disease each year for lack of funds and logistics to see the protection applied – **9 million** babies in all have died since 1968. Complete lack of concern, a bystander effect, prevailed in the West until Steven Spitalnik founded nonprofit WIRhE in 2019 to resolve it. WIRhE members have done extensive studies and designed global prevention protocols but so far have been unable to raise the **$250 million** required annually to prevent Rh disease in developing countries.

Around 2020 John Gorman working with WIRhE came up with TCRA, a simple high finance deal of unusual design that will fund WIRhE with a $**10 billion** endowment in very short order. This high finance deal is now **the only realistic way** to save the Rh babies' lives. **There is no other realistic way.** TCRA is straightforward to execute. It is financially sound. It is existential. Unless this pure Wall Street deal closes, **140,000** Rh babies will continue to die each year for ever.

A terrible disease that has been plaguing humanity for **65,000** years may **at last be at an end,** like smallpox is and polio and measles can be some day. With this more than adequate endowment, **WIRhE can flourish for hundreds of years**, and be counted on to maintain the global logistics to protect all the Rh Negative mothers in perpetuity in the whole world. **WIRhE will own Rh Disease in medical history books**.
